

1. The Big Bang

Summary: After the big bang the current world order collapses in just a few weeks or days.

In previous chapters you have read about the following five endgames:

1. **Israel Vanished:** In this endgame, the tensions in the Middle East run high. After Jewish extremists have destroyed the mosque on the Temple Mount, Muslim extremists drop a nuclear bomb on Israel.
2. **American Revolution:** In this endgame, more and more rumors and scandals about election fraud, 9/11 pretexts, illegal wars and self-enrichment of PNAC leaders come to light. After the people of the United States turn in large numbers against their government, countrywide pillaging and clashes with police and army deliver the final blow to the fragile American economy.
3. **Corporations Win:** In this endgame, people in the western world suffer from more and more environmental disasters caused by out-of-control corporations. One of them causes the collapse of the western economy's foundations.
4. **The Failed Amero:** In this endgame, PNAC leaders try to replace the weakened American dollar by the Amero and fail.
5. **2012 and Niburu:** In this endgame, rare planet and star positions cause major earthquakes, tsunamis and volcano eruptions. The potential passing of planet Niburu suddenly inverts the planet's magnetic field and causes our planet to flip over and rotate the other way around.

I don't know which of these endgames has the highest likelihood of turning into a *big bang*. If you look at statistics, then this fifth endgame has probably a million times smaller chance of happening than the chance of a solar eclipse, but does that tell it all?

All endgames have in common the fact that their symptoms can already be measured and verified today. Those who are in power, our presidents, may have been informed about them and they may have discussed amongst themselves the likelihood of an impending *big bang*. But they think of the short term and in their own interest first. They don't want to be the harbingers of the bad tidings while in power; they may be held responsible! They won't say anything, and we choose to ignore the symptoms as well. We don't want to connect the dots because we cannot imagine that *everything* could end, and we don't know a way out so we prefer to leave the responsibility to our leaders.

Before describing what will happen to the world when one of the endgames from the previous chapters comes true, let me share with you what happened to a tiny island about 400 years ago.

1.1 The Parable Of Easter Island

Easter Island is the most remote habitable island on our planet. It is located in the Pacific Ocean, and the nearest mainland is Chili, which is about 4000 km away. Around 700 AD, a few Polynesian people in canoes discovered the island. The small island only measures 22x11km, roughly the size of the isle of Jersey, and at that time it was covered with palm trees and full of birds. The Polynesians settled down and lived an isolated existence for about nine hundred years. The society flourished with abundant sea life and farming to feed a growing population. The people's success manifested itself in a form that has become the Island's iconic trademark: nine hundred immense stone figures – moai.

They were all carved in one big quarry. Initially, the carving of just one moai took years, but by the end of their civilization, the people were capable of finishing a few of them per year. Some weighed 80 tons, twice the weight of the figures at Stonehenge, and they were transported and erected up to 16km from the quarry. The moai were the 'living faces of their ancestors' and each totem looked different to immortalize a particular chief. With their back to the ocean, their eyes of coral segments overlooked and protected the inhabitants from disasters from the outside world.

Figure 1 Moai on Easter Island

Over the centuries, the Easter Islanders developed themselves into three different clans, but they lived peacefully together until the very end. They built bigger and bigger moai and they needed more and more trees to transport them to the platforms.

One day, during a big storm, around 1600 AD, with most of the trees gone, the rains washed away their precious soil and the crops failed. With only a few trees left, most of the birds didn't come back. A famine broke out and the clan leaders sent their best canoeists out for help. But the journey was long and dangerous and when nobody returned, the clan leaders became nervous. There was no wood for

canoes, so no more fish. And no more canoes also meant no way left to escape. The Easter Islanders were trapped in a hell of their own making. They turned against their clan leaders, and they, in turn, blamed their people. Afraid of a revolution, the leaders claimed that the people had failed the ancestors by not producing new moai in time. "If you wouldn't have been behind schedule, those storms would never have come. It's your own fault!" The clan leaders also knew that no more moai meant that they *themselves* wouldn't have a place to rest in the afterlife, but they didn't mention that. They just claimed that the best way to solve the problem was to quickly erect new moai. But there were not enough trees anymore to transport and erect three moai! So, which clan would be allowed to use the last trees?

Inspired by their clan leaders, the clans started to claim ownership over the last trees and they created spears to defend them. Each clan felt they had the most rights, but all for different reasons. One clan thought that their ancestors were the biggest and most powerful; the other thought that they had the most rights because they lived closest to the quarry, and the third clan claimed ownership because they had the strongest men and the sharpest spears. They couldn't agree on a solution and one morning, after another storm, the clan with the strongest men discovered that one of their moai had been pushed over! They suspected the other clans of a deliberate act and to get even, the next night they pushed

over a moai of the other tribes. Soon they all turned on each other and the moai who had failed them. Suddenly, the tribes who had lived peacefully together for nearly a thousand year were now at war with each other.

Easter Island is such a small island that you can stand on the summit and see the whole place. The person who cut down the last tree must have known that it was the last tree, but he still cut it down! The death of the last tree was the limit. They now started to kill and even to eat each other. In less than a few months, the total population of more than 12,000 people was reduced to a few dozen.

On the verge of extinction, the Easter Islanders realized that if they continued the killing, they would all die. So, they finally sat together and came up with a plan. They would not eat the last sugar cane and sweet potatoes, but they would use them as seed for the next season. For the time being, they would use the flesh of the victims to keep themselves alive and to lure the fish to the coast in order to catch them without boats.

When the crops were ready to harvest, each clan chief nominated a young champion. Those young men would climb down a cliff, plunge into the water, swim for their lives approximately to the largest of three small islets, and there they would await the coming of the birds. The champion's mission was to grab the first egg to be laid. When the first egg was found by one of those individuals, he placed it in a woven basket that he could wear on his head for its protection and he would then plunge back into the waters, which were full of sharks most of the time, and swim back, climb back up the cliff and present the egg to the person who had sponsored him. Whichever tribe won the race was crowned 'The Birdman'. That tribe then won the first claim on the island's diminishing resources for a year. It was an ingenious solution. The aggression that had once led to fighting had been turned into a harmless competition that led to an orderly parceling out of food. The islanders had saved themselves from extinction. At last.

Imagine You Were a Messenger

Imagine that you, with your insights and experience from the 21st century could visit this small distant island a few months before the storm destroyed their crops. You would immediately understand what they were doing to honor their ancestors, but also that their deforestation was a serious threat to their existence. It would be evident to you that there was something wrong with their *belief system*! You would probably throw out something like: "Hey guys, this is totally crazy. You don't need these stones of your ancestors, and they don't really help you to survive. It's all in your mind. You are destroying yourselves!" With some modern insights you could continue with: "You had better turn to cultivating sugar cane and sweet potatoes and let the trees live. Only use dead branches and leaves to work the ground. Your resources are limited and if you don't cooperate peacefully and wisely you will all die!"

What do you think the islanders would think of you and your bad tidings? Their clan leaders would probably fear that their statue would not be ready when they die and they would not have a place to rest. For that reason they would probably feel their position was severely threatened and they would behave as if they were offended. They would say you were sent by enemies from other tribes and they would suspect you of telling 'lies' to take over their leadership! You would not have chosen the correct wording and protocols to deliver your message and they would attack you for that. They would probably have ignored, scandalized, jailed, tortured or killed you. And of course, they would have set up their

clans against you to have them do the dirty work. You shouldn't have intervened with their 'internal affairs' anyway. An outsider cannot be right if he says something different than the clan leader...

Discussion

How effectively does your culture deal with bad tidings from an outsider today? Here is an example to help your discussion:

Imagine that your culture strongly discourages or even forbids teenagers to exploit and experience their budding sexual desires. As a result, these children close themselves off from their feelings and consider that as "good". Often, nature goes its own way. When these children engage in secret and irresponsible sexual acts, as they feel "bad" and frustrate themselves, as well as their parents. Pregnancies become "unwanted".

Now, an outsider tells your culture that this ban is unnatural and counter-productive. He or she suggests revisiting the *beliefs* of your culture and the development of a society that stays closer to nature instead of curbing children.

How would your culture react to such a message? How long would it take your culture to make the necessary changes? What would have to be changed?

1.2 The Argentinean Big Bang

An important warning to humanity of the upcoming *big bang* was the Argentinean meltdown in December 2001, and the months before this crisis hit the newspapers. This crash was evoked by the inevitable IMF decision to cut off its lending to Argentina. By that time, the total debt of Argentina had amounted to a staggering US\$185 billion, whereas the other side of the state's balance had been 'plundered' to nearly zero: the state's crown jewels (mines, utility companies, postal system, airline, big private companies, etc) had been sold to American and other foreign corporations and the earnings had mostly been used for interest payments to the IMF, the World Bank and other foreign institutions. Other large sums made from deals never made it back to Argentina for less noble reasons. These had been stored in bank accounts in Uruguay, Miami and Zurich, safely out of reach to the common people of Argentina, the state's assets registry and most importantly the creditors that would inevitably retrieve them after the crash. Whatever happened to those billions, they were not reinvested in Argentina; not in its assets, not in innovative industry, not in the country's infrastructure and definitely not in the education or social well-being of the common people.

In the beginning of 2001, it became clear to IMF staff, bankers, business leaders and politicians all over the world with interests in Argentina that Argentina's banking system was indeed going to crash. What did these men do? They quickly moved their remaining deposits to accounts abroad, which in fact accelerated the crash! Some of them literally flew out tons of cash by private jets. Meanwhile, they continued to recommend Argentinean customers, workers and voters to continue *making* deposits. In this way the crash came as a surprise to the common people of Argentina while the bankers, business leaders and politicians had secured their own financial safety. In December 2001, the common people had to swallow the fact that their money, their savings, their pensions, their jobs and stability had vanished, along with the corporations and leaders they trusted.

Of course, at the moment the news broke, the common people tried to copy the example of their leaders, but by then the government installed the 'corralito', a decree by which people could no longer take their money out of the banks. This 'corralito' led to massive demonstrations and looting. To make matters worse, the Central Bank 'suddenly' stopped exchanging 1 peso for 1 American dollar and left the exchange rate floating in the market. The peso became very volatile, and in a few days one peso was worth even four times less in dollar terms. What little money the common people still had in their banks was worth only a fraction of what it used to be. As a result the property market collapsed because the peso was too volatile for big transactions and no one had dollars to buy anything. The banks, that first helped the Haves and topped the Have-Nots from bringing their saving into safety, now started to expel people from their homes who no longer could pay of their loans anymore. The crisis was complete and the Argentinean game was over.

1.3 The Planetary Big Bang

I believe that we, humanity as a whole, will experience the same sooner than later. Our leaders will not inform us about the impending crash and this crash will come, one way or the other. And it will come with the tiding that our money, our savings, our pensions, our jobs and our stability will have gone, along with the corporations and leaders we trusted... This will happen unexpectedly to most of us.

One thing all the endgames have in common is that the cork will blow off the funnel with a *big bang*. With Argentina, it was the IMF's decision to cut off its lending, but it can be anything else and all the people in the world will be affected, even the most feminine cultures in democratic countries on the top of the funnel: Sweden, Norway, Denmark, Finland and The Netherlands.

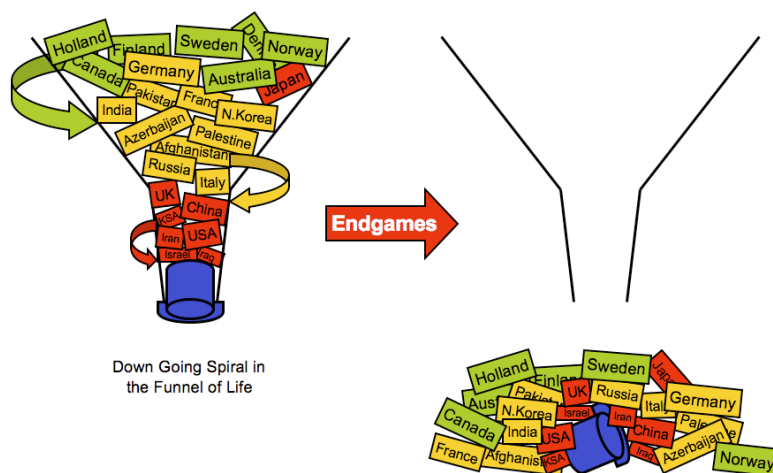

Figure 2 The cork blows off the funnel of life

The *big bang* can be one or more of many things: the dropping of a nuclear bomb on Israel, an outbreak of riots in all major cities in the United States against the government, an American attack on another country against the will and interests of China, the bankruptcy of an American car producer, major hedge fund or credit debt insurer, the outbreak of a deadly infectious disease or a major environmental disaster in the western world, a major tsunami, flood or earthquake hitting the western world or major industrial areas in China, a major nuclear accident in the western world, a real and major terrorist attack,

a virus paralyzing communication networks and the internet, etcetera. The actual *big bang* will probably be a combination of out-of-control factors that cannot be predicted at this time.

When the IMF made the decision that would lead to Argentina's big bang, they did not inform the general public. The same will be the case with the planetary *big bang*. On the day of the *big bang*, millions of people will still not hear, understand or believe that the game of planet Earth is really over. They will not even be able to grasp the possibility that life as they have known and experienced it could ever be over. But in the days and weeks after the *big bang* they will be forced to accept that reality while they fight for their survival, and probably fail. The endgames that have been played until this *big bang* will cause the world order to collapse like a house of cards in a couple of weeks or days. One process will trigger the next, like falling dominos.

I believe that soon after the *big bang*, the world will turn into one big Cuba: Billions of people will fight for their survival whereas their leaders, the 'winners' can no longer spend their money.

The coming paragraphs will describe the processes after the *big bang*. These processes will take their course, sequentially and simultaneously and they will reinforce each other. In fact, in a couple of weeks or months, the endgames that have been played out will rapidly come to an end like a game of Monopoly comes to its end. At the very moment that one player 'wins' because he¹ owns all the hotels, houses and money bills, the game will be over: not only all the other players have been played off the board, also the winner cannot play himself anymore. His hotels, houses and money bills have become worthless. There is no longer anyone to play *with*.

Even if our leaders try to force some people to prepare them a meal or drive them to one of their palaces, sooner or later they will get stuck due to a lack of electricity, gas, resources or supplies. At some point, our leaders will experience that their fight for the survival of the fittest has, in fact, caused *everybody's* downfall, including their own. They will, of course, still have more soldiers, guards, guns and whips to defend themselves and to appropriate the last assets, but these assets will no longer guarantee their survival. On the contrary: they will enrage the have-nots. These assets will just give our leaders the illusion that they are winning until their very end. They will die, but only while killing more subordinates. What a Piraeus victory!

After the *big bang*, all processes will come into a rapid spin. It is impossible to describe all of them here or to speculate in which order they will occur. *Everything* that we know and hold onto will come to an end. So I am trying to describe the indescribable here. The coming paragraphs only illustrate the 'highlights'.

1.4 The Downfall Of Capitalistic Consumerism

After the *big bang*, the business world will immediately dive into a deep crisis. Corporations will do everything they can to stay in business; they will claim as many resources as they can (before their

¹ 'He' refers to the straight males who are 'winning' the current endgames.

competition does). Since the government will not control them properly in this crisis situation, they will take their chances and grab while the grabbing is good. Business leaders will profit as much as possible from this grabbing by selling shares, extracting pre-payments, and transferring funds to private accounts, hoping that it will help them to survive personally in the likely event that their business goes bankrupt. At the same time, they will postpone payments to their workers to build up reserves and to lower that risk of bankruptcy. They know that their employees are stuck anyway because in time of crisis nobody wants to hire them. These employees, in turn, will try to stop their leaders from doing that. When they fail, these workers will follow their leader's example and plunder their workplaces by putting their production tools out of order, and by taking as many valuables home as possible. As a result, in a few weeks or months, the whole production infrastructure will be destroyed.

1.5 The Downfall Of Social Networks

Many people will die immediately as a result of the *big bang*. If a nuclear bomb is dropped, then millions of people will also get sick and know that they will die due to radiation. The more people are threatened with imminent death, the easier it becomes to accept the idea of dying, and the less they value their own life and the lives of others. More and more, people will volunteer to become suicide terrorists. The prevailing thoughts will become: "If I have to live in poverty from now on, let my death be the retaliation for what they have taken from me." Or: "Let my death be the retaliation for what they have done to me." It is a downward spiral that can no longer be stopped.

With the *big bang*, the last strings of friendship, compassion and love will break between different cultures and between different groups and classes within the same culture. The very way in which we experience ourselves through others, diversity, will start to work against humanity. The deeply ingrained survival instinct of human beings living today will urge them to fight for their lives, and for the lives of their very close relatives. The more difficult the situation becomes, the closer their circle gets. In countries with a strong masculine and individualistic culture like the United States, the fighting will be more intense than in countries with a strong feminine and more collectivistic culture, like Sweden. But ultimately, everywhere on the planet, people will fight and kill each other with increasing speed.

1.6 The Downfall Of Merciful Democracies

The world is becoming less merciful and less democratic day by day. At this moment, there is not a single country in the world that is becoming more democratic or merciful. In the name of 'security', democratic principles and protection constructions for the vulnerable are being undermined in exchange for additional powers for the rulers.

In our society, it is common practice that the vulnerable are exploited. That's what we do. This exploitation is best minimized in a feminine culture in combination with democracy. In such a culture

there is the natural desire to stand up for the needy. Democracy will then ensure that the interests of those who feel superior will not be forced upon those they consider inferior. A good example of such a 'merciful democracy' was the Netherlands in the 1960s. At that time, a system of sociopolitical segments protected all religions and gave them sufficient social security to develop themselves in whatever they believed was right.

Israel in the beginning of the 21st century is an example of the opposite. In this country, there has never been a strong urge to stand up for non-Jews. The more extreme religious Jews gain political control, the closer this religion comes to its own downfall. The exclusion of the interests of the - in their eyes - 'inferior religions' will be the final blow for their democracy. Until now, this democracy has kept all religions in the country in balance as a counter weight to the Jewish supremacy. The political representation of the 'inferior religions' delays the growing domination of the Jews in such a way that the other religions have sufficient social security or keep the illusion that they will acquire this security at some point. By political exclusion, this security will be taken away from them. This will expedite the process towards the *big bang*. In the period just before this *big bang*, laws will be implemented allowing unbridled powers to Jews in Israel and the Palestinian Territories. This will have disastrous effects on the non-Jews in this part of the Middle East.

After the *big bang*, Jews will abuse their powers to bump off those who will then be poorly protected. As a result, people everywhere on the planet will come to blows with each other.

1.7 The Downfall Of Dogmatic Religions

Dogmatic religions have always been based upon two important principles: 'the love of our deity is conditional' and 'our religion is superior'. A few examples:

- Only if you believe what we believe, you belong with us
- Only if you live according to the rules of our holy scriptures, will you end up in heaven
- When you kill someone, our deity will punish you
- When other religions attack us, we may kill them

Deities like Adonai, Allah, God, Hari, Jehovah, Krishna, Lord, Rama, Vishnu, Yahweh and others have in common that their love, in the eyes of their believers, is conditional. The believers must do something to come into favor with their deities. Religions disagree on what needs to be done exactly, but they are all convinced that their religion has the better answers and is therefore superior to other religions.

Also within each religion, there is a system of superiority. Each religion has a hierarchal organization where the people on top of the ladder are supposed to be closest to their deity and therefore know best what he² wants. They then translate his wishes into rules and regulations. The laymen at the bottom of the ladder are trained to live according to these rules and regulations. In general, there is not much room for discussion or questioning the dogma.

² None of today's world religions depicts their deity as a woman.

Might is right, and the competition between the religions is growing. The strongest religion becomes the religion that acquires the most devotees. (According to human tradition, people will then think that religion is 'right'.) In an ongoing competition, converts are made by presenting a common front among the believers and by discouraging critical thinking about the given views. In some cases, apostates and believers who violate the rules and regulations are tortured or punished in extreme ways.

In general, rote learning is an effective method to make a religion stronger and those at the top more powerful. However, these leaders don't realize that by the decreasing ability for critical thinking, their religious community can show less and less flexibility when it is confronted with criticism from outsiders. As a result, the only thing that remains for a religious community after the *big bang* is: fighting. In this way, religions will fight each other as well as themselves to death. They will fight, regardless of historical ties: Shiites against Sunnis, Roman Catholics against Orthodox, Mormons against Protestants, etc. At that moment, humanity will experience that the religions have created what they feared most: Hell on Earth.

1.8 The End of Hell on Earth

When the current world order collapses as described in the previous paragraphs, billions of people will die. It is even possible that all six billion people will die. Life on this planet will then no longer exist and the Hell on Earth we created will die with us.

As I have indicated before, my objective with these books is to save at least one third of humanity. My hope is that 'only' 4 billion people will become victims as a result of the *big bang*. I cannot prevent this *big bang*. I am too miniscule and the world has become too polarized.

My personal attempt:

In the past, I did try to prevent the *big bang*. Between 1999 and 2003, I wrote a screenplay for a two-hour movie. The story depicted my raw reality, but it did have a happy ending, because there certainly is a way out of this Hell on Earth.

Unfortunately, when the script was ready, the media were already controlled by the PNAC leaders and totally in 'propaganda mode'. They would only free up large budgets for pulp films like Lord of the Rings, Kill Bill, the Matrix and United 93. These are all films with a lot of violence, but they have no relationship with today's reality. I therefore decided not to put the script up for sale anymore. It now serves as a blueprint for this trilogy – which will have a happy ending as well, just as in the movie. I promise.

I can try to offer an alternative, a way out for those who are brave enough to move the other way in time, against the mainstream. But I don't believe that this alternative will save more than 2 billion lives. First of all, people must be capable of reading these kind of books. Many people cannot read at all or cannot understand the concepts. Often they don't have the money to buy these books or download the ideas from the internet. Furthermore, these types of books are forbidden or censored in a lot of countries. Our leaders will ridicule their message, concoct mistakes and discourage or prohibit reading for moral or religious reasons. Of course, they will use their propaganda machines against them – starting by ignoring them. Then they will bring up arguments that take the attention away from their own failures.

Finally, in a lot of countries it is already too late. If you are in the middle of a very tense situation or if a war is being fought in your area, then you don't sit down to calmly read a book, let alone sit down with your opponents to solve your conflicts in a totally different manner.

Most of you will call for peace when it is too late, when you are convinced that your method will undoubtedly lead to your own destruction. This happened on Easter Island. On this island, the last survivors of their local cataclysm saved themselves and their civilization by doing things in a radically different way – by reaching out to the enemy. The coin had fallen, the karma was lived through and the alternative had come within reach. On Easter Island, Hell on Earth came to an end, but its civilization did not.

1.9 The Birth of Heaven on Earth

Soon after the *big bang*, people will start cutting trees everywhere to replace unavailable oil and coal products. These dead trees will release tons of CO₂ and humanity will destroy the very tool that is needed to take the CO₂ out of the air and produce oxygen. However, a few months after the *big bang*, there will be no more cities and forests burning, and there will hardly be any planes, cars or industries producing new smog. This will have a sudden, remarkable and irreversible effect to our planet: the sky will turn from milky blue to its original color: *dark blue*.

A dark blue sky:

I remember standing in the garden next to our house in the countryside of The Netherlands. It was in the 1960s and I was about eight years old. It was a nice warm spring day: about 25 degrees Celsius. It was extremely dry. Wherever I looked from horizon to horizon there were no clouds. On that moment the sky was dark blue. I asked myself why we only experienced these beautiful days in spring. During the summer, the warm days were usually humid and the sky was then almost always milky white. Thirty years later these dry, warm, spring days with dark blue skies have become extremely rare in the Netherlands and everywhere else. Our planet is now covered in smog, and our sky is now almost always milky blue. Wherever I traveled throughout world in recent years, from Melbourne to Montréal, and from Sakhalin to Singapore and San Diego, I never experienced this horizon-to-horizon dark blue sky anymore.

The dirty clouds filled with soot particles will come down as precipitation, and since we won't be producing much new smog anymore, the sky will become clear again. The survivors of the *big bang* will be able to rediscover hundreds of stars that were shielded from us for decades by the smog. This may be a beautiful sight, but it is not only good news. This dirty layer currently protects us from some of the sun's rays and compensates for the effects of global warming. This is called 'global dimming'. The problem is that although global dimming will come to an end, global warming will take hundreds or thousands of years to be reversed. As a result, the temperature on our planet will suddenly rise by a couple degrees! The consequences will be enormous.

Due to this sudden temperature rise, the ice in Greenland, the North Pole and South Pole will melt completely, and much more quickly than currently expected by our scientists. The melting will be spurred by the escape of methane locked under the polar ice and by the creation of methane from peat in the melting permafrost of Siberia. Methane is a greenhouse gas retaining 23 times more warmth than

carbon dioxide. One percent of temperature change will generate two percent of extra rain. So the *big bang* will not only wipe out most of humanity, it will also invoke a sudden and irreversible rise in temperature that will change the climate and habitat forever. It may start the planet's first *Tropical Age*. The planet will not become completely inhabitable, but none of the places where we currently live, will still be habitable after the *big bang*.

This may sound shocking to you now, but some of you will manage to survive the upcoming cataclysm, find a new place to live and finally see the sun rising in a dark blue sky. You will then understand and accept why you have chosen to be reincarnated in this extremely extraordinary moment in time and space in this far corner of the universe: you will witness the birth of *Heaven on Earth*.
